1 Introduction

2  
3 Management and storage of transuranic (**TRU**) mixed waste in the Waste Isolation Pilot Plant  
4 (**WIPP**) facility is subject to regulation under Title 20 of the New Mexico Administrative Code,  
5 Chapter 4, Part 1 (20.4.1 NMAC), Subpart V. The technical requirements of 20.4.1.500 NMAC  
6 (incorporating 40 CFR §§264.170 to 264.178) are applied to the operation of the Waste  
7 Handling Building Container Storage Unit (**WHB Unit**)(Figure M1-1), the Waste Handling  
8 Building Staging Area, TRUDOCK Staging Area, Room 108 and Airlock 107 Staging Area,  
9 TRUPACT Maintenance Facility (TMF) Staging Area, the Parking Area Staging Area and the  
10 Parking Area Container Storage Unit (**Parking Area Unit**) (Figure M1-2). This Permit  
11 Attachment describes the container storage units, the TRU mixed waste management facilities  
12 and operations, and compliance with the technical requirements of 20.4.1 NMAC. The  
13 configuration of the WIPP facility consists of completed structures, including all buildings and  
14 systems for the operation of the facility.

15  
16 M1-1a Containers with Residual Liquids

17  
18 The Permit Treatment, Storage, and Disposal Facility (TSDF) Waste Acceptance Criteria (WAC)  
19 and the Waste Analysis Plan (Permit Attachment B) prohibit the shipment of liquid waste to the  
20 WIPP. This prohibition is enforced as a maximum residual liquids requirement. In no case shall  
21 the total liquid equal or exceed one volume percent of the waste container (e.g., drum or  
22 standard waste box [SWB], or canister). Since the maximum amount of liquid is one percent,  
23 calculations made to determine the secondary containment as required by 20.4.1.500 NMAC  
24 (incorporating §264.175) are based on ten percent of one percent of the volume of the  
25 containers, or one percent of the largest container, whichever is greater. Any container which,  
26 through verification and examination, is identified as containing total liquids present that are  
27 equal to or greater than one volume percent of the waste container will be tagged as a non-  
28 conforming container and placed in an appropriate location until returned to the  
29 generator/storage site or sent off-site for remediation.

30  
31  
32 M1-1b Description of Containers

33 Contact handled (**CH**) TRU mixed waste containers will be either 55-gal (208-L) drums singly or  
34 arranged into 7-packs, 85-gal (321-L) drums singly or arranged into 4-packs, 100-gal (379 L)  
35 drums singly or arranged into 3-packs, ten-drum overpacks (**TDOP**), or SWBs. A summary  
36 description of each CH TRU mixed waste container type is provided below.

37  
38 Standard 55-Gallon Drums

39  
40 Standard 55-gal (208-L) drums meet the requirements for U.S. Department of Transportation

(DOT) specification 7A regulations.

A standard 55-gal (208-L) drum has a gross internal volume of 7.4 cubic feet (ft<sup>3</sup>) (0.210 cubic meters (m<sup>3</sup>)). Figure M1-3 shows a standard TRU mixed waste drum. One or more filtered vents (as described in Section M1-1d(1)) will be installed in the drum lid to prevent the escape of any radioactive particulates and to eliminate any potential of pressurization.

Standard 55-gal (208-L) drums are constructed of mild steel and may also contain rigid, molded polyethylene (or other compatible material) liners. These liners are procured to a specification describing the functional requirements of fitting inside the drum, material thickness and tolerances, and quality controls and required testing. A quality assurance surveillance program is applied to all procurements to verify that the liners meet the specification.

Standard 55-gal (208-L) drums may be used to collect derived waste.

#### Standard Waste Boxes

The SWBs meet all the requirements of DOT specification 7A regulations.

One or more filtered vents (as described in Section M1-1d(1)) will be installed in the SWB body and located near the top of the SWB to prevent the escape of any radioactive particulates and to eliminate any potential of pressurization. They have an internal volume of 66.3 ft<sup>3</sup> (1.88 m<sup>3</sup>). Figure M1-4 shows a SWB.

The SWB is the largest container that may be used to collect derived waste.

#### Ten-Drum Overpack

The TDOP is a metal container, similar to a SWB, that meets DOT specification 7A and is certified to be noncombustible and to meet all applicable requirements for Type A packaging. The TDOP is a welded-steel, right circular cylinder, approximately 74 inches (in.) (1.9 meters (m)) high and 71 in. (1.8 m) in diameter (Figure M1-5). The maximum loaded weight of a TDOP is 6,700 pounds (lbs) (3,040 kilograms (kg)). A bolted lid on one end is removable; sealing is accomplished by clamping a neoprene gasket between the lid and the body. One or more filter vents are located near the top of the TDOP on the body to prevent the escape of any radioactive particulates and to eliminate any potential of pressurization. A TDOP may contain up to ten standard 55-gal (208-L) drums or one SWB. TDOPs may be used to overpack drums or SWBs containing CH TRU mixed waste. The TDOP may also be direct loaded with CH TRU mixed waste. Figure M1-5 shows a TDOP.

1 Eighty-Five Gallon Drum

2  
3 The 85-gal (321-L) drums meet the requirements for DOT specification 7A regulations. One or  
4 more filtered vents (as described in Section M1-1d(1)) will be installed in the 85-gal drum to  
5 prevent the escape of any radioactive particulates and to eliminate any potential of  
6 pressurization.  
7

8 85-gal (321-L) drums are constructed of mild steel and may also contain rigid, molded  
9 polyethylene (or other compatible material) liners. These liners are procured to a specification  
10 describing the functional requirements of fitting inside the drum, material thickness and  
11 tolerances, and quality controls and required testing. A quality assurance surveillance program  
12 is applied to all procurements to verify that the liners meet the specification.  
13

14 The 85-gal (321-L) drum, which is shown in Figure M1-6, will be used for overpacking  
15 contaminated 55-gal (208 L) drums at the WIPP facility. The 85-gal drum may also be direct  
16 loaded with CH TRU mixed waste.  
17

18 85-gal (321-L) drums may be used to collect derived waste.  
19

20 100-Gallon Drum

21  
22 100-gal (379-L) drums meet the requirements for DOT specification 7A regulations.  
23

24 A 100-gal (379-L) drum has a gross internal volume of 13.4 ft<sup>3</sup> (0.38 m<sup>3</sup>). One or more filtered  
25 vents (as described in Section M1-1d(1)) will be installed in the drum lid or body to prevent the  
26 escape of any radioactive particulates and to eliminate any potential of pressurization.  
27

28 100-gal (379-L) drums are constructed of mild steel and may also contain rigid, molded  
29 polyethylene (or other compatible material) liners. These liners are procured to a specification  
30 describing the functional requirements of fitting inside the drum, material thickness and  
31 tolerances, and quality controls and required testing. A quality assurance surveillance program  
32 is applied to all procurements to verify that the liners meet the specification.  
33

34 100-gal (379-L) drums may be direct loaded.  
35

36 Remote-Handled (RH) TRU mixed waste containers include canisters, which are received at  
37 WIPP loaded singly in an RH-TRU 72-B cask, and drums, which are received in a CNS 10-160B  
38 cask.  
39

40 RH TRU Canister

1 The RH TRU canister is a steel single shell container which is constructed to be of high  
2 integrity. An example canister is depicted in Figure M1-16a. The RH TRU canister is vented  
3 and will have a nominal internal volume of 31.43 ft<sup>3</sup> (0.89 m<sup>3</sup>) and shall contain waste packaged  
4 in small containers (e.g., drums) or waste loaded directly into the canister.  
5  
6

#### 7 RH TRU Facility Canister

8

9 The RH TRU Facility Canister is a cylindrical container designed to hold up to three 55-gallon  
10 drums (Figure M1-16).  
11

#### 12 Standard 55-Gallon Drums

13

14 Standard 55-gal (208-L) drums meet the requirements for U.S. Department of Transportation  
15 (DOT) specification 7A regulations. A detailed description of a standard 55-gallon drum is  
16 provided above. Up to ten 55-gallon drums containing RH TRU mixed waste are arranged on  
17 two drum carriage units in the CNS 10-160B cask (up to five drums per drum carriage unit). The  
18 drums are transferred to an RH TRU mixed waste Facility Canister that will contain up to three  
19 drums.  
20  
21

#### 22 M1-1c(1) Waste Handling Building Container Storage Unit (WHB Unit)

23

24 The Waste Handling Building (WHB) is the surface facility where TRU mixed waste handling  
25 activities will take place (Figure M1-1). The WHB has a total area of approximately 84,000  
26 square feet (ft<sup>2</sup>) (7,804 square meters (m<sup>2</sup>)) of which 33,175 20,914.5 ft<sup>2</sup> (3,082 1,945.7 m<sup>2</sup>) are  
27 designated for the waste handling and container storage of CH TRU mixed waste and 17,403 ft<sup>2</sup>  
28 (1,617 m<sup>2</sup>) are designated for handling and storage of RH TRU mixed waste, as shown in  
29 Figures M1-1 and M1-17a, b and c. This area is being permitted as the WHB Unit. The concrete  
30 floors are sealed with a coating that is sufficiently impervious to the chemicals in TRU mixed  
31 waste to meet the requirements of 20.4.1.500 NMAC (incorporating 40 CFR §264.175(b)(1)).  
32

#### 33 Waste Handling Building and TMF Staging Areas

34

35 The Waste Handling Building Staging Areas include the WHB Staging Area, Room 108 and  
36 Airlock 107 Staging Area, TMF Staging Area and TRUDOCK Staging Area (Figure M1-1).  
37 These areas are designed to allow staging of CH TRU mixed waste until the requirements for  
38 verification and examination of Permit Attachment B7 have been met but not to exceed ten (10)  
39 days (plus 60 additional days for non-compliant waste).  
40

CH TRU Mixed Waste

The Contact Handled Packages used to transport TRU mixed waste containers will be received through one of three air-lock entries to the CH Bay of the WHB Unit. The WHB heating, ventilation and air conditioning (HVAC) system maintains the interior of the WHB at a pressure lower than the ambient atmosphere to ensure that air flows into the WHB, preventing the inadvertent release of any hazardous or radioactive constituents contamination as the result of a contamination event. The doors at each end of the air lock are interlocked to prevent both from opening simultaneously and equalizing CH Bay pressure with outside atmospheric pressure. The CH Bay houses two TRUPACT-II Docks (TRUDOCKs), each equipped with overhead cranes for opening and unloading Contact Handled Packages. The TRUDOCKs are within the TRUDOCK Storage Staging Area of the WHB Unit.

The cranes are rated to lift the Contact Handled Packaging lids as well as their contents. The cranes are designed to remain on their tracks and hold their load even in the event of a design-basis earthquake.

Upon receipt and removal of CH TRU mixed waste containers from the Contact Handled Packaging, the waste containers are required to be in good condition as provided in Permit Module III. The waste containers will be visually inspected for physical damage (severe rusting, apparent structural defects, signs of pressurization, etc.) and leakage to ensure they are good condition prior to staging, verification, examination or storage. Waste containers will also be checked for external surface contamination. If a primary waste container is not in good condition, the Permittees will overpack the container, repair/patch the container in accordance with 49 CFR §173 and §178 (e.g., 49 CFR §173.28), or return the container to the generator. The Permittees may initiate local decontamination, return unacceptable containers to a DOE generator site or send the Contact Handled Package to the third party contractor. Decontamination activities will not be conducted on containers which are not in good condition, or which are leaking. If local decontamination activities are opted for, the work will be conducted in the WHB Unit on the TRUDOCK. These processes are described in Section M1-1d. ~~The area previously designated as the Overpack and Repair Room will not be used for TRU mixed waste management in any instances.~~

Once unloaded from the Contact Handled Packaging, CH TRU mixed waste containers (7-packs, 3-packs, 4-packs, SWBs, or TDOPs) are placed in one of two positions on the facility pallet or on a containment pallet if destined for verification and examination. The waste containers are stacked, on the facility pallets (one- or two-high, depending on weight considerations). Waste on containment pallets will be stacked one-high. The use of facility or containment pallets will elevate the waste at least 6 in. (15 cm) from the floor surface. Pallets of waste requiring verification or examination will then be relocated to one of the approved Staging

Areas while the verification and examination requirements of Attachment B7 are met, the Northeast (NE) Storage Area of the WHB Unit for normal storage. This NE Storage Area, which is shown in Figure M1-7, will be clearly marked to indicate the lateral limits of the storage area. This NE Storage Area will have a maximum capacity of seven pallets (1,856 ft<sup>3</sup> [52.6 m<sup>3</sup>]) of TRU mixed waste containers during normal operations. These pallets will typically be staged placed in this a staging area for a period of up to five no more than ten (10) days. Staging Areas are the TRUDOCK Staging Area, the WHB Staging Area, Room 108 and Airlock 107 Staging Area, and the TMF Staging Area.

During this time period seven percent of the containers from each waste stream in each shipment will undergo verification and examination as defined in Attachment B7. Verification and examination of CH TRU mixed waste will occur either via radiography, visual examination (VE) or through a review of the VE records. Verification and examination of RH TRU mixed waste will occur through a review of VE records.

Each unverified and unexamined container assembly will be tagged to indicate that verification and examination has not occurred. No containers from an unverified and unexamined waste stream in an unverified and unexamined shipment can be placed in the repository.

Containers will be randomly selected to undergo verification and examination. The selected containers will be located and, if verification and examination is to be performed via radiography the selected container will be placed on a containment or facility pallet for transport to the radiography equipment. While in transit to the radiography equipment and during the verification and examination process, secondary containment will be provided by containment pallets or by the containment capability integral to the handling and processing equipment. After verification and examination is complete the container will be returned to the appropriate staging area. Waste stream shipments may not be disposed until the verification and examination data are approved in accordance with Attachment B7 of this HWFP. Waste that does not meet the requirements specified in Attachment B7 will be considered as non-conforming waste and will be held in an appropriate staging area while the discrepancy is resolved. Non-conforming waste may remain in the staging area for up to sixty (60) days from the date the non-conformance was discovered. If the non-conformance cannot be resolved with the generator site, the non-conforming waste will either be:

- resolved with the generator/storage site
- =
- returned to the generator/storage site
- =
- sent to another DOE facility for remediation
- =
- sent to an approved third party site for remediation
- =

Regardless of the resolution, the Permittees will notify the Secretary within twenty four (24)

1 hours from the time the discrepancy was discovered that a non-conforming waste is at the  
2 WIPP facility.

3  
4 Manifest discrepant payloads will be placed in an appropriate staging area in the WHB where  
5 they will be tagged and segregated from waste which is approved for emplacement or inside a  
6 Contact Handled Package, depending on when the discrepancy is discovered. The waste  
7 containers will be elevated off of the floor surface by means of either a facility or containment  
8 pallet unless inside a Contact Handled Package.  
9

10 ~~In addition, four Contact Handled Packages, containing up to eight 7-packs, 3-packs, 4-packs,~~  
11 ~~SWBs, or four TDOPs, may occupy the staging positions at the TRUDOCK Storage Area of the~~  
12 ~~WHB Unit. If waste containers are left in this area, they will be in the Contact Handled Package~~  
13 ~~with or without the shipping container lids removed. The maximum volume of waste in~~  
14 ~~containers in four Contact Handled Packages is 530.4 ft<sup>3</sup> (15 m<sup>3</sup>).~~  
15

16 The Derived Waste Storage Area of the WHB Unit is on the north wall of the CH Bay. This area  
17 will contain containers up to the volume of a SWB for collecting derived waste from all TRU  
18 mixed waste handling processes in the WHB Unit. The Derived Waste Storage Area is being  
19 permitted to allow containers in size up to a SWB to be used to accumulate derived waste. The  
20 volume of TRU mixed waste stored in this area will be up to 66.3 ft<sup>3</sup> (1.88 m<sup>3</sup>). The derived  
21 waste containers in the Derived Waste Storage Area will be stored on standard drum pallets,  
22 which are polyethylene trays with a grated deck, which will elevate the derived waste containers  
23 approximately 6 in. (15 cm) from the floor surface, and provide approximately 50 gal (190 L) of  
24 secondary containment capacity.  
25

26 ~~An area has also been designated for the temporary storage of waste containers for which~~  
27 ~~manifest discrepancies were noted after the Contact Handled Package was opened.~~  
28

29 ~~Discrepant payloads will be placed either in the Shielded Storage Area of the WHB Unit on a~~  
30 ~~facility pallet or inside a Contact Handled Package, depending on when the discrepancy is~~  
31 ~~discovered. In either case the waste containers will be elevated approximately six inches from.~~  
32 ~~The storage capacity of this area is one pallet load of TRU mixed waste containers (i.e., 4~~  
33 ~~SWBs, 2 TDOPs, or 28 drums, or combinations of all three).~~  
34

35 Aisle space shall be maintained in all WHB Unit TRU mixed waste staging or storage areas. The  
36 aisle space shall be adequate to allow unobstructed movement of fire-fighting personnel, spill-  
37 control equipment, and decontamination equipment that would be used in the event of an off-  
38 normal event. An aisle space of 44 in. (1.1 m) between facility pallets will be maintained in all  
39 WHB Unit TRU mixed waste storage areas.  
40

1 The WHB has been designed to meet DOE design and associated quality assurance  
2 requirements. Table M1-1 summarizes basic design requirements, principal codes, and  
3 standards for the WIPP facility. Appendix D2 of the WIPP RCRA Part B Permit Application  
4 (DOE, 1997a) provided engineering design-basis earthquake and tornado reports. The design-  
5 basis earthquake report provides the basis for seismic design of WIPP facility structures,  
6 including the WHB foundation. The WIPP design-basis earthquake is 0.1 g. The WIPP design-  
7 basis tornado includes a maximum windspeed of 183 mi per hr (mi/hr) (294.5 km/hr), which is  
8 the vector sum of all velocity components. It is also limited to a translational velocity of 41 mi/hr  
9 (66 km/hr) and a tangential velocity of 124 mi/hr (200 km/hr). Other parameters are a radius of  
10 maximum wind of 325 ft (99 m), a pressure drop of 0.5 lb per in.<sup>2</sup> (3.4 kilopascals [kPa]), and a  
11 rate-of-pressure drop of 0.09 lb/in.<sup>2</sup>/s (0.6 kPa/s). A design-basis flood report is not available  
12 because flooding is not a credible phenomenon at the WIPP facility. Design calculations for the  
13 probable maximum precipitation (PMP) event, provided in Appendix D7 of the WIPP RCRA Part  
14 B Permit Application (DOE, 1997a), illustrated run-on protection for the WIPP facility.

15  
16 The following are the major pieces of equipment that will be used to manage CH TRU mixed  
17 waste in the container staging or storage units. A summary of equipment capacities, as required  
18 by 20.4.1.500 NMAC is included in Table M1-2.

#### 20 TRUPACT-II Type B Packaging

21  
22 The TRUPACT-II (Figure M1-8a) is a double-contained cylindrical shipping container 8 ft (2.4 m)  
23 in diameter and 10 ft (3 m) high. It meets NRC Type B shipping container requirements and has  
24 successfully completed rigorous container-integrity tests. The payload consists of approximately  
25 7,265 lbs (3,300 kg) gross weight in up to fourteen 55-gal (208-L) drums, eight 85-gal (322-L)  
26 drums, six 100-gal (379-L) drums, two SWBs, or one TDOP.

#### 28 HalfPACT Type B Packaging

29  
30 The HalfPACT (Figure M1-8b) is a double-contained right cylindrical shipping container 7.8  
31 ft (2.4 m) in diameter and 7.6 ft (2.3 m) high. It meets NRC Type B shipping container  
32 requirements and has successfully completed rigorous container-integrity tests. The payload  
33 consists of approximately 7,600 lbs (3,500 kg) gross weight in up to seven 55-gal (208-L)  
34 drums, one SWB, or four 85-gallon drums.

1     Unloading Docks

2  
3     Each TRUDOCK is designed to accommodate up to two Contact Handled Packages. The  
4     TRUDOCK functions as a work platform, providing TRU mixed waste handling personnel easy  
5     access to the container during unloading operations (see Figure M1-9) (Also see  
6     Drawing 41-M-001-W in Appendix D3 of the WIPP RCRA Part B Permit Application (DOE,  
7     1997a)).

8  
9     Forklifts

10  
11     Forklifts will be used to transfer the Contact Handled Packages into the WHB Unit and may be  
12     used to transfer palletized CH TRU mixed waste containers to the facility transfer vehicle.  
13     Another forklift will be used for general-purpose transfer operations. This forklift has  
14     attachments and adapters to handle individual TRU mixed waste containers, if required.

15  
16     Cranes and Adjustable Center-of-Gravity Lift Fixtures

17  
18     At each TRUDOCK, an overhead bridge crane is used with a specially designed lift fixture for  
19     disassembly of the Contact Handled Packages. Separate lifting attachments have been  
20     specifically designed to accommodate SWBs and TDOPs. The lift fixture, attached to the crane,  
21     has built-in level indicators and two counterweights that can be moved to adjust the center of  
22     gravity of unbalanced loads and to keep them level.

23  
24     Facility or Containment Pallets

25  
26     The facility pallet is a fabricated steel unit designed to support 7-packs, 4-packs, or 3-packs of  
27     drums, SWBs, or TDOPs, and has a rated load of 25,000 lbs. (11,430 kg). The facility pallet will  
28     accommodate up to four 7-packs, four 3-packs, or four 4-packs of drums or four SWBs (in two  
29     stacks of two units), two TDOPs, or any combination thereof. Loads are secured to the facility  
30     pallet during transport to the emplacement area. Facility pallets are shown in Figure M1-10.  
31     Fork pockets in the side of the pallet allow the facility pallet to be lifted and transferred by forklift  
32     to prevent direct contact between TRU mixed waste containers and forklift tines. This  
33     arrangement reduces the potential for puncture accidents. Facility pallets may also be moved by  
34     facility transfer vehicles. WIPP facility operational documents define the operational load of the  
35     facility pallet to ensure that the rated load of a facility pallet is not exceeded.

36  
37     Containment pallets are fabricated units having a containment capacity of at least ten percent of  
38     the volume of the containers and designed to support a minimum of either a single drum, a  
39     single SWB or a single TDOP. The pallets will have a rated load capacity of equal to or greater  
40     than the gross weight limit of the container(s) to be supported on the pallet. Loads are secured

1 to the containment pallet during transport. A typical containment pallet is shown in Figure M1-  
2 10a. Fork pockets in the side of the pallet allow the containment pallet to be lifted and  
3 transferred by forklift. WIPP facility operational documents define the operational load of the  
4 containment pallet to assure that the rated load of a containment pallet is not exceeded.

#### 5 6 Facility Transfer Vehicle

7  
8 The facility transfer vehicle is a battery or electric powered automated vehicle that either  
9 operates on tracks or has an on-board guidance system that allows the vehicle to operate on  
10 the floor of the WHB. An integrated or removable roller bed will be used to move pallets on and  
11 off the vehicle. It is designed with a flat bed that has adjustable height capability and will transfer  
12 waste payloads on facility pallets to the storage areas be used to transfer the facility pallets on  
13 or off the pallet support stands in the waste hoist cage by raising and lowering the bed (see  
14 Figure M1-11).

#### 15 16 RH TRU Mixed Waste

17  
18 The RH TRU mixed waste is handled and stored in the RH Complex of the WHB Unit which  
19 comprises the following locations: RH Bay (12,552 ft<sup>2</sup> (1,166 m<sup>2</sup>)), the Cask Unloading Room  
20 (382 ft<sup>2</sup> (36 m<sup>2</sup>)), the Hot Cell (1,841 ft<sup>2</sup> (171 m<sup>2</sup>)), the Transfer Cell (1,003 ft<sup>2</sup> (93 m<sup>2</sup>)) (Figures  
21 M1-17a, b and c), and the Facility Cask Loading Room (1,625 ft<sup>2</sup> (151 m<sup>2</sup>)).

22  
23 The RH Bay (Figure M1-14a) is a high-bay area for receiving casks and subsequent handling  
24 operations. The trailer carrying the RH-TRU 72-B or CNS 10-160B shipping cask (Figures M1-  
25 18, M1-19, M1-20 and M1-21) enters the RH Bay through a set of double doors on the east side  
26 of the WHB. The RH Bay houses the cask transfer car. The RH Bay is served by the RH Bay  
27 Overhead Bridge Crane used for cask handling and maintenance operations. Storage in the RH  
28 Bay occurs in the RH-TRU 72-B or CNS 10-160B casks. The storage occurs after the trailer  
29 containing the cask is moved into the RH Bay and prior to moving the cask into the Cask  
30 Unloading Room to stage the waste for disposal operations. A maximum of two loaded casks  
31 (146.93 ft<sup>3</sup> (4.16 m<sup>3</sup>)) and one 55-gallon drum for derived waste may be stored in the RH Bay.

32  
33 The Cask Unloading Room (Figure M1-17a) provides for transfer of the RH-TRU 72-B cask to  
34 the Transfer Cell, or the transfer of drums from the CNS 10-160B cask to the Hot Cell. Storage  
35 in the Cask Unloading Room will occur in the RH-TRU 72-B or CNS 10-160B casks. Storage in  
36 this area typically occurs at the end of a shift or in an off-normal event that results in the  
37 suspension of waste handling operations. A maximum of one cask (73.47 ft<sup>3</sup> (2.08 m<sup>3</sup>)) may be  
38 stored in the Cask Unloading Room.

39  
40 The Hot Cell (Figure M1-17b) is a concrete shielded room in which drums of RH TRU mixed

1 waste will be transferred remotely from the CNS 10-160B cask, staged in the Hot Cell, and  
2 loaded into a facility canister. The loaded facility canister is then lowered from the Hot Cell into  
3 the Transfer Cell shuttle car containing a shielded insert. Storage in the Hot Cell occurs in either  
4 drums or facility canisters. Drums that are stored are either on the drum carriage unit that was  
5 removed from the CNS 10-160B cask or in a facility canister. A maximum of 10 drums and 6  
6 loaded facility canisters (262.02 ft<sup>3</sup> (7.42 m<sup>3</sup>)) and one 55-gallon drum for derived waste may be  
7 stored in the Hot Cell.

8  
9 The Transfer Cell (Figure M1-17c) houses the Transfer Cell Shuttle Car, which moves the RH-  
10 TRU 72-B cask or shielded insert into position for transferring the canister to the facility cask.  
11 Storage in this area typically occurs at the end of a shift or in an off-normal event that results in  
12 the suspension of a waste handling evolution. A maximum of one canister (31.43 ft<sup>3</sup> (0.89 m<sup>3</sup>))  
13 may be stored in the Transfer Cell in the Transfer Cell Shuttle Car.

14  
15 The Facility Cask Loading Room (Figure M1-17d) provides for transfer of a canister to the  
16 facility cask for subsequent transfer to the waste hoist and to the Underground Hazardous  
17 Waste Disposal Unit (HWDU). The Facility Cask Loading Room also functions as an air lock  
18 between the Waste Shaft and the Transfer Cell. Storage in this area typically occurs at the end  
19 of a shift or in an off-normal event that results in the suspension of waste handling operations. A  
20 maximum of one canister (31.43 ft<sup>3</sup> (0.89 m<sup>3</sup>)) may be stored in the Facility Cask (Figure M1-23)  
21 in the Facility Cask Loading Room.

22  
23 Following is a description of major pieces of equipment that are used to manage RH TRU mixed  
24 waste in the WHB Unit. A summary of equipment capacities, as required by 20.4.1.500 NMAC,  
25 is included in Table M1-3.

## 26 Casks

27  
28  
29 The RH-TRU 72-B cask (Figure M1-20) is a cylinder designed to meet U.S. Department of  
30 Transportation (DOT) Type B shipping container requirements. It consists of a separate inner  
31 vessel within a stainless steel, lead-shielded outer cask protected by impact limiters at each  
32 end, made of stainless steel skins filled with polyurethane foam. The inner vessel is made of  
33 stainless steel and provides an internal containment boundary and a cavity for the payload.  
34 Neither the outer cask nor the inner vessel is vented. Payload capacity of each RH-TRU 72-B  
35 shipping cask is 8,000 lbs (3,628 kg). The payload consists of a canister of RH TRU mixed  
36 waste, which may contain up to 31.43 ft<sup>3</sup> (0.89 m<sup>3</sup>) of directly loaded waste or waste in smaller  
37 containers.

38  
39 The CNS 10-160B cask (Figure M1-21) is designed to meet DOT Type B container  
40 requirements and consists of two carbon steel shells and a lead shield, welded to a carbon steel

1 bottom plate. A 12-gauge stainless steel thermal shield surrounds the cask outer shell, which is  
2 equipped with two steel-encased, rigid polyurethane foam impact limiters attached to the top  
3 and bottom of the cask. The CNS 10-160B cask is not vented. Payload capacity of each CNS  
4 10-160B cask is 14,500 lbs (6,577 kg). The payload consists of up to ten 55-gallon drums.

#### 5 6 CNS 10-160B Drum Carriage

7  
8 The CNS 10-160B drum carriage (Figure M1-25) is a steel device used to handle drums in the  
9 CNS 10-160B cask. The drum carriages are stacked two high in the CNS 10-160B cask during  
10 shipment. They are removed from the cask using a below-the-hook lifting device termed a  
11 pentapod. The drum carriage is rated to lift up to five drums with a maximum weight of 1000  
12 pounds each.

#### 13 14 RH Bay Overhead Bridge Crane

15  
16 In the RH Bay, an overhead bridge crane is used to lift the cask from the trailer and place it on  
17 the Cask Transfer Car. It is also used to remove the impact limiters from the casks and the outer  
18 lid of the RH-TRU 72-B cask.

#### 19 20 Cask Lifting Yoke

21  
22 The lifting yoke is a lifting fixture that attaches to the RH Bay Overhead Bridge Crane and is  
23 designed to lift and rotate the RH-TRU 72-B cask onto the Cask Transfer Car.

#### 24 25 Cask Transfer Car

26  
27 The Cask Transfer Car (Figure M1-22 and M1-24) is a self-propelled, rail-guided vehicle, that  
28 transports the cask between the RH Bay and the Cask Unloading Room.

#### 29 30 6.25 Ton Grapple Hoist

31  
32 A 6.25 Ton Grapple Hoist is used to hoist the canister from the Transfer Cell Shuttle Car into the  
33 facility cask.

#### 34 35 Facility Cask

36  
37 The facility cask body consists of two concentric steel cylinders. The annulus between the  
38 cylinders is filled with lead, and gate shield valves are located at either end. Figure M1-23  
39 provides an outline configuration of the facility cask. The canister is placed inside the facility  
40 cask for shielding during canister transfer from the RH Complex to the Underground HWDU for

emplacement.

### Facility Cask Transfer Car

The Facility Cask Transfer Car (Figure M1-24) is a self-propelled rail car that is used to move the facility cask between the Facility Cask Loading Room and the Shaft Station in the underground.

### Hot Cell Bridge Crane

The Hot Cell Overhead Bridge Crane, outfitted with a rotating block and the Facility Grapple, will be used to lift the CNS 10-160B lid and the drum carriage units from the cask located in the Cask Unloading Room, into the Hot Cell. The Hot Cell Overhead Bridge Crane is also used to lift the empty disposal canisters into place within the Hot Cell, move loaded drums into the facility canister, and lower loaded canisters into the Transfer Cell.

### Overhead Powered Manipulator

The Overhead Powered Manipulator is used in the Hot Cell to lift individual drums from the drum carriage unit and lower each drum into the facility canister and support miscellaneous Hot Cell operations.

### Manipulators

There is a maximum of two operational sets of fixed Manipulators in the Hot Cell. The Manipulators collect swipes of drums as they are being lifted from the drum carriage unit and transfer the swipes to the Shielded Material Transfer Drawer and support Hot Cell operations.

### Shielded Material Transfer Drawer

The Shielded Material Transfer Drawer is used to transfer swipe samples obtained by the fixed Manipulators to the Hot Cell Gallery for radiological counting and transferring small equipment into and out of the Hot Cell.

### Closed-Circuit Television Camera

The Closed-Circuit Television Camera monitors Hot Cell and Transfer Cell operations. These operations are observed from the shielded room in the Facility Cask Loading Room and Hot Cell Gallery.

Transfer Cell Shuttle Car

The Transfer Cell Shuttle Car positions the loaded RH-TRU 72-B cask and shielded insert within the Transfer Cell.

Cask Unloading Room Crane

The Cask Unloading Room Crane lifts and suspends the RH-TRU 72-B cask or shielded insert from the Transfer Car and lowers the cask or shielded insert into the Transfer Cell Shuttle Car.

M1-1c(2) Parking Area Container Storage Unit (Parking Area Unit)

The parking area south of the WHB (see Figure M1-2) will be used for staging or storage of waste containers within sealed shipping containers awaiting unloading. The area ~~extending south from the WHB within the fenced enclosure identified as the Controlled Area on in~~ Figure M1-2 is defined as the Parking Area Unit. The Parking Area Unit provides storage ~~space for for~~ up to 7,160 ft<sup>3</sup> (202.5 m<sup>3</sup>) of CH TRU mixed waste, contained in up to 12 50 loaded Contact-Handled Packages corresponding to 1,591 ft<sup>3</sup> (45m<sup>3</sup>) of CH TRU mixed waste. and 14 Remote-Handled Packages. Secondary containment and protection of the waste containers from standing liquid are provided by the Contact- or Remote- Handled Packaging. Wastes placed in the Parking Area Unit will remain sealed in their Contact- or Remote- Handled Packages at all times while in this area. Also shown on Figure M1-2 is the Parking Area Staging Area. This Staging Area may contain up to 50 CH Packages and 14 RH Packages while the verification and examination requirements of Attachment B7 are met but no longer than ten (10) days. The maximum capacity of the Parking Area Staging or Storage Areas is limited to 50 CH Packages and 14 RH TRU Packages either in a single storage/staging area or in combination of both.

~~The maximum number of Contact Handled Packages that will be stored in the Parking Area is twelve, containing a maximum of 1,591 ft<sup>3</sup> (45m<sup>3</sup>) of CH TRU mixed waste. The Nuclear Regulatory Commission (NRC) Certificate of Compliance requires that sealed Contact- or Remote- Handled Packages, which contain waste, be vented every 60 days to avoid unacceptable levels of internal pressure. Therefore, during normal waste handling operations, no Contact Handled Packages will require venting while located in the Parking Area Unit. Any off-normal event which results in the need to store a waste container in the Parking Area Unit for a period of time approaching fifty-nine (59) days shall be handled in accordance with Section M1-1e(2) of this Permit Attachment. Under no circumstances shall a Contact- or Remote- Handled Package be stored in the Parking Area Unit for more than fifty-nine (59) days after the date that the inner containment vessel of the Contact- or Remote- Handled Packages was~~

sealed at the generator site.

M1-1d Container Management Practices

20.4.1.500 NMAC (incorporating 40 CFR §264.173) requires that containers be managed in a manner that does not result in spills or leaks. Containers are required to be closed at all times, unless waste is being placed in the container or removed. Because containers at the WIPP will contain radioactive waste, safety concerns require that containers be continuously vented to obviate the buildup of gases within the container. These gases could result from radiolysis, which is the breakdown of moisture by radiation. The vents, which are nominally 0.75 in. (1.9 centimeters [cm]) in diameter, are generally installed on or near the lids of the containers. These vents are filtered so that gas can escape while particulates are retained.

TRU mixed waste containers, containing off-site waste, are never opened at the WIPP facility. Derived waste containers are kept closed at all times unless waste is being added or removed.

~~The typical processing rate for CH TRU mixed waste is 14 Contact Handled Packages per day, or seven pallet loads, and the maximum is 28 per day. Two shifts per day are planned, four days per week. The fifth day is for equipment maintenance with weekends available for more extensive maintenance, when necessary.~~

Off-normal events could interrupt normal operations in the waste management process line. These off normal events fall into the following categories:

- Waste management system equipment malfunctions
- Waste shipments with unacceptable levels of surface contamination
- Hazardous Waste Manifest discrepancies that are not immediately resolved
- A suspension of emplacement activities for regulatory reasons

Shipments of waste from the generator sites will be stopped in any event which results in an interruption to normal waste handling operations that exceeds three days.

Prior to receipt of TRU mixed waste at the WIPP facility, waste operators will be thoroughly trained in the safe use of TRU mixed waste handling and transport equipment. The training will include both classroom training and on-the-job training.

M1-1d(2) CH TRU Mixed Waste Handling

CH TRU mixed waste containers will arrive by tractor-trailer at the WIPP facility in sealed shipping containers (e.g., TRUPACT-IIs or HalfPACTs) (see Figure M1-12), at which time they will undergo security and radiological checks and shipping documentation reviews. A forklift will remove the Contact Handled Packages and will transport them a short distance through an air lock that is designed to maintain differential pressure in the WHB. The forklift will place the shipping containers at one of the two TRUDOCKs in the TRUDOCK ~~Storage~~ Staging Area of the WHB Unit, where an external survey of the Contact Handled Package inner vessel (see Figure M1-8a and M1-8b) will be performed as the outer containment vessel lid is lifted. The inner vessel lid will be lifted under the TRUDOCK Vent Hood System (VHS), and the contents will be surveyed during and after this lift. The TRUDOCK VHS<sup>1</sup> is attached to the Contact Handled Package to provide atmospheric control and confinement of headspace gases at their source. It also prevents potential personnel exposure and facility contamination due to the spread of radiologically contaminated airborne dust particles and minimizes personnel exposure to VOCs.

Contamination surveys at the WIPP facility are based in part on radiological surveys used to indicate potential releases of hazardous constituents from containers by virtue of detection of radioactive contamination (see Permit Attachment I3). Radiological surveys may be applicable to most hazardous constituent releases except the release of gaseous VOCs from TRU mixed waste containers. Radiological surveys provide the WIPP facility with a very sensitive method of indicating the potential release of nongaseous hazardous constituents through the use of surface sampling (swipes) and radioactivity counting. Radiological surveys are used in addition to the more conventional techniques such as visual inspection to identify spills.

Under normal operations, it is not expected that the waste containers will be externally contaminated or that removable surface contamination on the shipping package or the waste containers will be in excess of the DOE's free release limits (i.e.; < 20 disintegrations per minute

---

<sup>1</sup> The TRU mixed waste container headspace may contain radiologically contaminated airborne dust particles.

1. Without the TRUDOCK VHS, a potential mechanism will exist to spread contamination (if present) in the immediate CH TRU mixed waste handling area, because lid removal will immediately expose headspace gases to prevailing air currents induced by the building ventilation system.
2. With the VHS, a confined and controlled set of prevailing air currents will be induced by the system blower. The TRUDOCK VHS will function as a local exhaust system to effectively control radiologically contaminated airborne dust particles (and VOCs) at essentially atmospheric pressure conditions.

Functionally, the TRUDOCK VHS will draw the TRU mixed waste container headspace gases, convey them through a HEPA filter, and ultimately duct them through the WHB exhaust ventilation system. VOCs will pass through the HEPA filter and will be conveyed to the ventilation exhaust duct system. The system principally consists of a functional aggregation of 1) vent hood assembly, 2) HEPA filter assemblies (to capture any airborne radioactive particles), 3) blower (to provide forced airflow), 4) ductwork, and 5) flexible hose.

(dpm)<sup>2</sup> per 100 cm<sup>2</sup> alpha or < 200 dpm per 100 cm<sup>2</sup> beta/gamma). In such a case, no further decontamination action is needed. The shipping package and waste container will be handled through the normal process. However, should the magnitude of contamination exceed the free release limits, yet still fall within the criteria for small area "spot" decontamination (i.e., less than or equal to 100 times the free release limit and less than or equal to 6 ft<sup>2</sup> [0.56 m<sup>2</sup>]), the shipping package or the waste container will be decontaminated. Decontamination activities will not be conducted on containers which are not in good condition, or containers which are leaking. Containers which are not in good condition, and containers which are leaking, will be overpacked, repaired/patched in accordance with 49 CFR §173 and §178 (e.g., 49 CFR §173.28), or returned to the generator. In addition, if during the waste handling process at the WIPP a waste container is breached, it will be overpacked, repaired/patched in accordance with 49 CFR §173 and §178 (e.g., 49 CFR §173.28), or returned to the generator. Should WIPP structures or equipment become contaminated, waste handling operations in the affected area will be immediately suspended.

Decontamination activities will use water and cleaning agents (see Permit Attachment F) so as to not generate any waste that cannot be considered derived waste. Items that are radiologically contaminated are also assumed to be contaminated with the hazardous wastes that are in the container involved in the spill or release. A complete listing of these waste components can be obtained from the WIPP Waste Identification System (WWIS), as described in Permit Attachment B, for the purpose of characterizing derived waste.

It is assumed that the process of decontamination will remove the hazardous waste constituents along with the radioactive waste constituents. To provide verification of the effectiveness of the removal of hazardous waste constituents, once a contaminated surface is demonstrated to be radiologically clean, the "swipe" will be sent for analysis for hazardous constituents. The use of these confirmation analyses is as follows:

For waste containers, the analyses becomes documentation of the condition of the container at the time of emplacement. The presence of hazardous waste constituents on a container after decontamination will be at trace levels and will likely not be visible and will not pose a threat to human health or the environment. These containers will undergo verification and examination and, after verification and examination approval, be placed in the underground without further action once the radiological contamination is removed unless there is visible evidence of hazardous waste spills or hazardous waste on the container and this contamination is considered likely to be released prior to emplacement in the underground.

---

<sup>2</sup> The unit "dpm" stands for "disintegration per minute" and is the rate of emission by radioactive material as determined by correcting the counts per minute observed by an appropriate detector for background, efficiency, and geometric factors associated with the instrumentation.

1 For area contamination, once the area is cleaned up and is shown to be radiologically clean, it  
2 will be sampled for the presence of hazardous waste residues. If the area is large, a sampling  
3 plan will be developed which incorporates the guidance of EPA's SW 846 in selecting random  
4 samples over large areas. Selection of constituents for sampling analysis will be based on  
5 information (in the WWIS) about the waste that was spilled and information on cleanup  
6 procedures. If the area is small, swipes will be used. If the results of the analysis show that  
7 residual contamination remains, a decision will be made whether further cleaning will be  
8 beneficial or whether final clean up shall be deferred until closure. For example, if hazardous  
9 constituents react with the floor coating and are essentially nonremovable without removing the  
10 coating, then clean up will be deferred until closure when the coatings will be stripped. In any  
11 case, appropriate notations will be entered into the operating record to assure proper  
12 consideration of formerly contaminated areas at the time of closure. Furthermore, measures  
13 such as covering, barricading, and/or placarding will be used as needed to mark areas that  
14 remain contaminated.

15  
16 Small area decontamination, if needed, will occur in the area in which it is detected for  
17 contamination that is less than 6 ft<sup>2</sup> (0.56 m<sup>2</sup>) in area and is less than 100 times the free release  
18 limit. The free release limit is defined by DOE Orders as alpha contamination less than 20  
19 dpm/100 cm<sup>2</sup> and beta-gamma contamination less than 200 dpm/100 cm<sup>2</sup>. Overpacking would  
20 occur in the event the WIPP staff damages an otherwise intact container during handling  
21 activities. In such a case, a radiological boundary will be established, inside which all activities  
22 are carefully controlled in accordance with the protocols for the cleanup of spills or releases. A  
23 plan of recovery will be developed and executed, including overpacking the damaged container  
24 in either a 85-gal (321 L) drum, SWB, or a TDOP. The overpacked container will be properly  
25 labeled, and sent underground for disposal once the shipment it is associated with is verified  
26 and examined. The area will then be decontaminated and verified to be free of contamination  
27 using both radiological and hazardous waste sampling techniques (essentially, this is done with  
28 "swipes" of the surface for counting in sensitive radiation detection equipment or, if no  
29 radioactivity is present, by analysis for hazardous waste by an offsite laboratory).

30  
31 In the event a large area contamination is discovered within a Contact-Handled Package during  
32 unloading, the waste will be left in the Contact-Handled Package and the shipping container will  
33 be resealed. The DOE considers such contamination problems the responsibility of the shipping  
34 site. Therefore, the shipper will have several options for disposition. These are as follows:

- 35  
36 ● The Contact-Handled Package can be returned to the shipper for  
37 decontamination and repackaging of the waste. Such waste would have to be re-  
38 approved prior to shipment to the WIPP.
- 39  
40 ● Shipment to another DOE site for management in the event the original shipper

1 does not have suitable facilities for decontamination. If the repairing site wishes  
2 to return the waste to WIPP, the site will have to meet the **characterization**  
3 **verification and examination** requirements of the WAP.  
4

- 5 • The waste could go to a third (non-DOE) party for decontamination. In such  
6 cases, the repaired shipment would go to the original shipper and be recertified  
7 prior to shipment to the WIPP.  
8

9 Written procedures specify materials, protocols, and steps needed to put an object into a safe  
10 configuration for decontamination of surfaces. A RWP will always be prepared prior to  
11 decontamination activities. TRU mixed waste products from decontamination will be managed  
12 as derived waste.<sup>3</sup>  
13

14 The TRUPACT-II may hold up to two 7-packs, two 4-packs, two 3-packs, two SWBs, or one  
15 TDOP. A HalfPACT may hold seven 55-gal (208-L) drums, one SWB, or four 85-gallon drums.  
16 An overhead bridge crane will be used to remove the contents of the Contact Handled Package  
17 and place them on a facility pallet. The containers will be visually inspected for physical damage  
18 (severe rusting, apparent structural defects, signs of pressurization, etc.) and leakage to ensure  
19 they are in good condition prior to storage. Waste containers will also be checked for external  
20 surface contamination. If a primary waste container is not in good condition, the Permittees will  
21 overpack the container, repair/patch the container in accordance with 49 CFR §173 and §178  
22 (e.g., 49 CFR §173.28), or return the container to the generator.  
23

24 Each waste stream in each shipment will also undergo verification and examination to assure  
25 that there is no ignitable, corrosive or reactive waste present. Verification and examination of  
26 CH-TRU mixed waste will occur either via radiography, VE or through a review of the VE  
27 records in each shipment. Containers that have not been verified and examined will be staged  
28 in an appropriate staging area.  
29

30 Each unverified and unexamined container assembly will be tagged to indicate that verification  
31 and examination has not occurred. No containers from an unverified and unexamined waste  
32 stream in a shipment can be placed in the repository.  
33

34 Containers will be randomly selected to undergo verification and examination. The selected  
35 containers will be located and, if verification and examination is to be performed via radiography  
36 the selected container will be placed on a facility or containment pallet for transport to the

---

<sup>3</sup> Note that the DOE had previously proposed use of an Overpack and Repair Room to deal with major decontamination and overpacking activities. The DOE has eliminated the need for this area by: 1) limiting the size of contamination events that will be dealt with as described in this section, and 2) by performing overpacking at the point where a need for overpacking is identified instead of moving the waste to another area of the WHB. This strategy minimizes the spread of contamination.

1 radiography equipment. After verification and examination is complete the container will be  
2 returned to the appropriate Staging Area. Waste stream shipments may not be disposed until  
3 the verification and examination data are approved in accordance with Attachment B7 of this  
4 HWFP. If the verification and examination results are not approved following options available  
5 are:

- 6
- 7     •     Verify and examine all other containers within that shipment,
- 8
- 9     •     The Contact-Handled Package can be returned to the generator/storage site for  
10 remediation of the container. Such waste would have to be re-approved prior to  
11 shipment to the WIPP,
- 12
- 13     •     Shipment to another off-site facility for management. If the site wishes to return  
14 the waste to WIPP, the waste will have to meet the generator/storage site's  
15 waste analysis requirements in accordance with the HWFP WAP,
- 16

17 For inventory control purposes, TRU mixed waste container identification numbers will be  
18 verified against the Uniform Hazardous Waste Manifest and the WWIS. Inconsistencies will be  
19 resolved with the generator before TRU mixed waste is emplaced. Discrepancies that are not  
20 resolved within 15 days will be reported to the NMED in accordance with 20.4.1.500 NMAC  
21 (incorporating 40 CFR §264.72).

22

23 Each facility pallet has two recessed pockets to accommodate two sets of 7-packs, two sets of  
24 4-packs, two sets of 3-packs, or two SWBs stacked two-high, two TDOPs, or any combination  
25 thereof. After verification and examination, each Each stack of waste containers will be secured  
26 prior to transport underground (see Figure M1-10). A forklift or the facility transfer vehicle will  
27 transport the loaded facility pallet to the conveyance loading room located adjacent to the  
28 Waste Shaft. The conveyance loading room serves as an air lock between the CH Bay and the  
29 Waste Hoist Shaft, preventing excessive air flow between the two areas. The facility transfer  
30 vehicle will be driven onto the waste hoist deck, where the loaded facility pallet will be  
31 transferred to the waste hoist, and the facility transfer vehicle will be backed off. Containers of  
32 CH TRU mixed waste (55-gal (208 L) drums, SWBs, 85-gal (321 L) drums, 100-gal (379-L)  
33 drums, and TDOPs) can be handled individually, if needed, using the forklift and lifting  
34 attachments (i.e., drum handlers, parrot beaks).

35

36 The waste hoist will lower the loaded facility pallet to the Underground HWDUs. Figure M1-13 is  
37 a flow diagram of the CH TRU mixed waste handling process.

38

39 M1-1d(3) RH TRU Mixed Waste Handling

40

1 The RH TRU mixed waste will be received in the RH-TRU 72-B cask or CNS 10-160B cask  
2 loaded on a trailer, as illustrated in process flow diagrams in Figures M1-26 and M1-27,  
3 respectively. These are shown schematically in Figures M1-28 and M1-29. Upon arrival at the  
4 gate, external radiological surveys, security checks, and shipping documentation reviews are  
5 performed. Upon completion of these checks, the Uniform Hazardous Waste Manifest is signed,  
6 and the generator's copy of the Uniform Hazardous Waste Manifest is returned to the generator.  
7 Should the surface dose rate exceed acceptable levels, the shipping cask and transport trailer  
8 remain outside the WHB in the Parking Area Staging Area, and the appropriate radiological  
9 boundaries (i.e., ropes, placards) are erected around the shipping cask and transport trailer. A  
10 determination will be made whether to return the cask to the originating site or to decontaminate  
11 the cask.

12  
13 Following cask inspections, the shipping cask and trailer are moved into the RH Bay or held in  
14 the Parking Area Staging Area. The waste handling process begins in the RH Bay where the  
15 impact limiter(s) are removed from the shipping cask while it is on the trailer. Additional  
16 radiological surveys are conducted on the end of the cask previously protected by the impact  
17 limiter(s) to verify the absence of contamination. The cask is unloaded from the trailer using the  
18 RH Bay Overhead Bridge Crane and placed on a Cask Transfer Car.

#### 19 20 RH-TRU 72-B Cask Unloading

21  
22 The Cask Transfer Car then moves the RH-TRU 72-B cask to a work stand in the RH Bay. The  
23 work stand allows access to the head area of the RH-TRU 72-B cask for conducting radiological  
24 surveys, performing physical inspections or minor maintenance, and decontamination, if  
25 necessary. The outer lid bolts on the RH-TRU 72-B cask are removed, and the outer lid is  
26 removed to provide access to the lid of the cask inner containment vessel. The RH-TRU 72-B  
27 cask is moved into the Cask Unloading Room by a Cask Transfer Car and is positioned under  
28 the Cask Unloading Room Bridge Crane. The Cask Unloading Room Bridge Crane attaches to  
29 the RH-TRU 72-B cask and lifts and suspends the RH-TRU 72-B cask to clear the Cask  
30 Transfer Car. The RH-TRU 72-B cask is aligned over the Cask Unloading Room port.

31  
32 The Cask Unloading Room shield valve is opened, and the cask is lowered through the port into  
33 the Transfer Cell Shuttle Car. The Cask Unloading Room Bridge Crane is unhooked and  
34 retracted, and the Cask Unloading Room shield valve is closed. After the cask is lowered into  
35 the Transfer Cell Shuttle Car, the bolts on the lid of the cask inner containment vessel are  
36 loosened by a robotic Manipulator. The Transfer Cell Shuttle Car is then aligned directly under  
37 the Transfer Cell shield valve in preparation for removing the inner vessel lid and transferring  
38 the canister to the facility cask. Operations in the Transfer Cell are monitored by closed-circuit  
39 video cameras.

1 Using the remotely-operated fixed 6.25 Ton Grapple Hoist in the Facility Cask Loading Room,  
2 the inner vessel lid is lifted clear of the RH-TRU 72-B cask, and the robotic Manipulator takes  
3 swipe samples and places them in a swipe delivery system for counting outside the Transfer  
4 Cell. If found to be contaminated above acceptable levels, a determination is made whether to  
5 return the canister and cask to the originating site or to overpack the canister. If no  
6 contamination is found, the Transfer Cell Shuttle Car moves a short distance, and the inner  
7 vessel lid is lowered onto a stand on the Transfer Cell Shuttle Car. The canister is transferred to  
8 the facility cask as described below.

9  
10 CNS 10-160B Cask Unloading

11  
12 After the lid bolts are removed, the CNS 10-160B cask is moved using the Cask Transfer Car  
13 from the RH Bay into the Cask Unloading Room and centered beneath the Hot Cell shield plug  
14 port. The Cask Unloading Room shield door is closed, and the inner and outer Hot Cell shield  
15 plugs are removed and set aside on the floor of the Hot Cell using the remotely operated Hot  
16 Cell Bridge Crane. The Hot Cell Bridge Crane is then lowered through the Hot Cell port and is  
17 connected to the CNS 10-160B cask lid rigging or lifting device. The Hot Cell Bridge Crane lifts  
18 the CNS 10-160B cask lid through the Hot Cell port and sets the lid aside on the Hot Cell floor.

19  
20 Operations in the Hot Cell are monitored by closed-circuit television cameras. The drum  
21 carriage unit lifting fixture (hereafter referred to as lifting fixture) is attached to the Hot Cell  
22 Bridge Crane and lowered through the Hot Cell port. The lifting fixture is connected to the upper  
23 drum carriage unit contained in the CNS 10-160B cask. The Hot Cell Bridge Crane lifts the  
24 upper drum carriage unit from the CNS 10-160B cask through the port into the Hot Cell and sets  
25 it near the Hot Cell inspection station. The Hot Cell Bridge Crane again lowers the lifting fixture  
26 through the Hot Cell port and connects to the lower drum carriage unit. The Hot Cell Bridge  
27 Crane lifts the lower drum carriage unit from the CNS 10-160B cask through the port into the  
28 Hot Cell and sets it near the upper drum carriage unit.

29  
30 The Hot Cell Bridge Crane lifts the CNS 10-160B cask lid from the Hot Cell floor, lowers it  
31 through the Hot Cell port and onto the top of the CNS 10-160B cask. The inner and outer Hot  
32 Cell shield plugs are replaced. The Cask Unloading Room shield door is opened, and the CNS  
33 10-160B cask is moved into the RH Bay using the Cask Transfer Car. The CNS 10-160B cask is  
34 inspected and surveyed, the lid and impact limiter are reinstalled on the CNS 10-160B cask, and  
35 it is prepared for transportation off-site.

36  
37 The Hot Cell Bridge Crane connects to an empty facility canister, places it into a sleeve at the  
38 inspection station, and removes the canister lid. The Overhead Powered Manipulator or Hot Cell  
39 Crane lifts one drum from the drum carriage unit. The Hot Cell Manipulators collect swipe  
40 samples from the drum and transfer the swipes via the Transfer Drawer to the Hot Cell Gallery

1 for counting. The drum identification number is recorded, and the recorded numbers are verified  
2 against the WIPP Waste Information System (WWIS). If there are any discrepancies, the  
3 drum(s) in question are stored within the Hot Cell, and the generator/storage site is contacted  
4 for resolution. Discrepancies that are not resolved within 15 days will be reported to the New  
5 Mexico Environment Department (NMED) as required by 20.4.1.500 NMAC (incorporating 40  
6 CFR §264.72).

7  
8 Either the Overhead Powered Manipulator or Hot Cell Bridge Crane lowers the drum into the  
9 facility canister. This process is repeated to place three drums in the facility canister. The Hot  
10 Cell Bridge Crane or powered Manipulator lifts the canister lid and places it onto the facility  
11 canister. The lid is locked in place using a Manipulator or secured with the robotic welder. Each  
12 CNS 10-160B cask shipment will contain up to ten drums. Drums will be managed in sets of  
13 three. If there is a tenth drum, it will be placed in a facility canister or stored until WIPP receipt of  
14 the next CNS 10-160B cask shipment. The Hot Cell Bridge Crane lifts the canister and lowers it  
15 into the Transfer Cell.

16  
17 To prepare to transfer a loaded facility canister from the Hot Cell to the Transfer Cell, a shielded  
18 insert is placed onto a Cask Transfer Car in the RH Bay. The Cask Transfer Car is then moved  
19 into the Cask Unloading Room and positioned under the Cask Unloading Room Bridge Crane.  
20 The Bridge Crane attaches to the shielded insert. The Cask Unloading Room Bridge Crane lifts  
21 and suspends the shielded insert clear of the Cask Transfer Car. The shielded insert is aligned  
22 over the Cask Unloading Room port. The floor valve is opened, and the shielded insert is  
23 lowered into the Transfer Cell Shuttle Car. The Cask Unloading Room Bridge Crane is  
24 unhooked and retracted, and the Cask Unloading Room shield valve is closed. The shielded  
25 insert is positioned under the Hot Cell port.

26  
27 The Hot Cell Bridge Crane lifts a loaded, closed facility canister and positions it over the Hot  
28 Cell port. The Hot Cell shield valve is opened, and the crane lowers the canister through the  
29 port into the shielded insert positioned in the Transfer Cell Shuttle Car in the Transfer Cell. The  
30 Hot Cell Bridge Crane is disconnected from the facility canister and raised until the crane hook  
31 clears the Hot Cell shield valve. The Hot Cell shield valve is then closed.

#### 32 33 Transfer of Disposal Canister into the Facility Cask

34  
35 The transfer of a canister into the facility cask from the Transfer Cell is monitored by closed-  
36 circuit television cameras. The Transfer Cell Shuttle Car positions the RH-TRU 72-B cask or  
37 shielded insert under the Facility Cask Loading Room port and the shield valve is opened. Then  
38 the remotely operated 6.25 Ton Grapple Hoist attaches to the canister, and the canister is lifted  
39 through the open shield valve into the vertically-oriented facility cask located on the Cask  
40 Transfer Car in the Facility Cask Loading Room. During this cask-to-cask transfer, the

telescoping port shield is in contact with the underside of the facility cask to assure shielding continuity, as does the shield bell located above the facility cask.

For canisters received at the WIPP from the generator site in a RH-TRU 72-B cask, the identification number is verified using cameras, which also provide images of the canister surfaces during the lifting operation. Identification numbers are verified against the WWIS. If there are any discrepancies, the canister is returned to the RH-TRU 72-B cask, returned to the Parking Area Staging Area, and the generator is contacted for resolution. Discrepancies that are not resolved within 15 days will be reported to the NMED as required by 20.4.1.500 NMAC (incorporating 40 CFR §264.72). As the canister is being lifted from the RH-TRU 72-B cask into the facility cask, additional swipe samples may be taken.

#### Transfer of the Canister to the Underground

When the canister is fully within the facility cask, the lower shield valve is closed. The 6.25 Ton Grapple Hoist detaches from the canister and is raised until the 6.25 Ton Grapple Hoist clears the facility cask, at which time the upper shield valve is closed. The 6.25 Ton Grapple Hoist and shield bell are then raised clear of the facility cask, and the telescoping port shield is retracted. The Facility Cask Rotating Device rotates the facility cask until it is in the horizontal position on the facility Cask Transfer Car. The shield doors on the Facility Cask Loading Room are opened, and the facility Cask Transfer Car moves onto the waste hoist conveyance and is lowered to the waste Shaft Station underground. At the waste Shaft Station underground, the facility Cask Transfer Car moves the facility cask from the waste hoist conveyance. A forklift is used to remove the facility cask from the facility Cask Transfer Car and to transport the facility cask to the Underground HWDU.

#### Returning the Empty Cask

The empty RH-TRU 72-B cask or shielded insert is returned to the RH Bay by reversing the process. In the RH Bay, swipe samples are collected from inside the empty cask. If necessary, the inside of the cask is decontaminated. The RH-TRU 72-B cask lids are replaced, and the cask is replaced on the trailer using the RH Bay Bridge Crane. The impact limiters are replaced, and the trailer and the RH-TRU 72-B cask are then moved out of the RH Bay. The shielded insert is stored in the RH Bay until needed.

#### M1-1e Inspections

Inspection of containers and container storage and staging areas are required by 20.4.1.500 NMAC (incorporating 40 CFR §264.174). These inspections are described in this section.

1 M1-1e(1) WHB and TMF Unit

2  
3 The waste containers in storage or staging within the WHB or staging in the TMF will be visually  
4 inspected visually or by closed-circuit television camera prior to each movement and, at a  
5 minimum, weekly, to ensure that the waste containers are in good condition and that there are  
6 no signs that a release has occurred. Waste containers will be visually inspected for physical  
7 damage (severe rusting, apparent structural defects, signs of pressurization, etc.) and leakage.  
8 If a primary waste container is not in good condition, the Permittees will overpack the container,  
9 repair/patch the container in accordance with 49 CFR §173 and §178 (e.g., 49 CFR §173.28), or  
10 return the container to the generator. This visual inspection of CH TRU mixed waste containers  
11 shall not include the center drums of 7-packs and waste containers positioned such that visual  
12 observation is precluded due to the arrangement of waste assemblies on the facility pallets. If  
13 waste handling operations should stop for any reason with containers located in the TRUDOCK  
14 Storage Staging Area in the Contact Handled Package, primary waste container inspections will  
15 not be accomplished until the containers of waste are removed from the Contact Handled  
16 Package. If the lid to the Contact Handled Package inner container vessel is removed,  
17 radiological checks (swipes of Contact Handled Package inner surfaces) will be used to  
18 determine if there is contamination within the Contact Handled Package. Such contamination  
19 could indicate a waste container leak or spill. Using radiological surveys, a detected spill or leak  
20 of a radioactive contamination from a waste container will also be assumed to be a hazardous  
21 waste spill or release.

22  
23 Inspections of the Shielded Storage Area ~~designated for holding waste while manifest~~  
24 ~~discrepancies are resolved~~, are performed prior to use and weekly thereafter, so long as waste  
25 containers reside in the Shielded Storage Area. Waste containers residing within a Contact  
26 Handled Package are not inspected, as described in the first bullet in Section M1-1e(2).

27  
28 Loaded RH-TRU 72-B and CNS 10-160B casks will be inspected when present in the RH Bay.  
29 Physical or closed-circuit television camera inspections of the RH Complex are conducted as  
30 described in Table D-1a. Canisters loaded in an RH-TRU 72-B cask are inspected in the  
31 Transfer Cell during transfer from the cask to the facility cask. Waste containers received in  
32 CNS 10-160B casks are inspected in the Hot Cell during transfer from the cask to the CNS 10-  
33 160B facility canister by camera and/or visual inspection (through shield windows).

34  
35 ~~Waste containers will be inspected prior to reentering the waste management process line for~~  
36 ~~downloading to the underground. Waste containers stored in this area will be inspected at least~~  
37 ~~once weekly.~~  
38

1 M1-1e(2) Parking Area Unit and Parking Area Staging Area

2  
3 Inspections will be conducted in the Parking Area Unit and Parking Area Staging Area at a  
4 frequency not less than once weekly when waste is present. These inspections are applicable  
5 to loaded, stored Contact- or Remote-Handled Packages. The perimeter fence located at the  
6 lateral limit of the Parking Area Unit, coupled with personnel access restrictions into the WHB,  
7 will provide the needed security. The perimeter fence and the southern border of the WHB shall  
8 mark the lateral limit of the Parking Area Unit and Parking Area Staging Area (Figure M1-2).  
9 Inspections of the Contact- or Remote-Handled Packages stored or staged in the Parking Area  
10 Unit and Parking Area Staging Area will focus on the inventory and integrity of the shipping  
11 containers and the spacing between Contact- or Remote-Handled Packages. This spacing will  
12 be maintained as indicated in Condition III.A.2.e at a minimum of four feet.

13  
14 Contact- or Remote-Handled Packages located in the Parking Area Unit and Parking Area  
15 Staging Area will be inspected weekly during use and prior to each reuse.

16  
17 Inspection of waste containers is not possible when the containers are in their shipping  
18 container (e.g., casks, TRUPACT-II or HalfPACTs). Inspections can be accomplished by  
19 bringing the shipping containers into the WHB Unit and opening them and lifting the waste  
20 containers out for inspection. The DOE, however, believes that removing containers strictly for  
21 the purposes of inspection results in unnecessary worker exposures and subjects the waste to  
22 additional handling. The DOE has proposed that waste containers need not be inspected at all  
23 until they are ready to be removed from the shipping container for emplacement underground.  
24 Because shipping containers are sealed and are of robust design, no harm can come to the  
25 waste while in the shipping containers and the waste cannot leak or otherwise be released to  
26 the environment. Contact- or Remote-Handled Packages shall be opened every 60 days for the  
27 purposes of venting, so that the longest waste would be uninspected would be for 60 days from  
28 the date that the inner containment vessel of the Contact- or Remote-Handled Package was  
29 closed at the generator site. Venting the Contact- or Remote-Handled Packages involves  
30 removing the outer lid and installing a tool in the port of the inner lid.

31  
32 The following strategy will be used for inspecting waste containers that will be retained within  
33 their shipping containers for an extended period of time:

- 34  
35 • If the reason for retaining the TRU mixed waste containers in the shipping  
36 container is due to an unresolved manifest discrepancy, the DOE will return the  
37 shipment to the generator prior to the expiration of the 60 day NRC venting  
38 period or within 30 days after receipt at the WIPP, whichever comes sooner. In  
39 this case, no inspections of the internal containers will be performed. The stored  
40 Contact- or Remote-Handled Package will be inspected weekly as described

above.

- If the reason for retaining the TRU mixed waste containers in the Contact-or Remote-Handled Package is due to an equipment malfunction that prevents unloading the waste in the WHB Unit, the DOE will return the shipment to the generator prior to the expiration of the 60 day NRC venting period. In this case, the DOE would have to ship the TRU mixed waste containers back with sufficient time for the generator to vent the shipment within the 60 day limit. In this case, no inspections of the internal containers will be performed. The stored Contact-or Remote-Handled Package will be inspected weekly as described above.
- If the reason for retaining the TRU mixed waste containers is due to an equipment malfunction that prevents the timely movement of the waste containers into the underground, the waste containers will be kept in the Contact-or Remote-Handled Package until day 30 (after receipt at the WIPP) or the expiration of the 60 day limit, whichever comes sooner. At that time the Contact-or Remote-Handled Package will be moved into the WHB and the TRU mixed waste containers removed and placed in one of the permitted storage areas in the WHB Unit. If there is no additional space within the permitted storage areas of the WHB Unit, the DOE will discuss an emergency permit with the NMED for the purposes of storing the waste elsewhere in the WHB Unit. Waste containers will be inspected when removed from the Contact-or Remote-Handled Packaging and weekly while in storage in the WHB Unit Contact-or Remote-Handled Packages will be inspected weekly while they contain TRU mixed waste containers as discussed above.

The DOE believes that this strategy minimizes both the amount of shipping that is necessary and the amount of waste handling, while maintaining a reasonable inspection schedule. The DOE will stop shipments of waste for any equipment outage that will extend beyond three days.

#### M1-1f Containment

The WHB Unit, WHB Staging Areas, TMF Staging Area and RH Complex has have concrete floors, which are sealed with a coating that is designed to resist all but the strongest oxidizing agents. Such oxidizing agents do not meet the TSDF-WAC and will not be accepted in TRU mixed waste at the WIPP facility. Therefore, TRU mixed wastes pose no compatibility problems with respect to the WHB Unit floor. The floor coating consists of Carboline® 1340 clear primer-sealer on top of prepared concrete, Carboline® 191 primer epoxy, and Carboline® 195 surface epoxy. The manufacturer's chemical resistance guide shows "Very Good" for acids and

"Excellent" for alkalis, solvents, salt, and water. Uses are indicated for nuclear power plants, industrial equipment and components, chemical processing plants, and pulp and paper mills for protection of structural steel and concrete. During the Disposal Phase, should the floors need to be re-coated, any floor coating used in the WHB Unit TRU mixed waste handling areas will be compatible with the TRU mixed waste constituents and will have chemical resistance at least equivalent to the Carboline® products. Figure M1-14 is a plan view M1-1 of the WHB, shows areas where CH TRU mixed waste handling activities discussed in this section occur.

During normal operations, the floor of the storage areas within the WHB Unit and WHB and TMF Staging Areas shall be visually inspected on a weekly basis to verify that it is in good condition and free of obvious cracks and gaps. Floor areas of the WHB Unit and WHB and TMF Staging Areas in use during off-normal events will be inspected prior to use and weekly thereafter. All TRU mixed waste containers located in the permitted storage areas and WHB and TMF Staging Areas shall be elevated at least 6 in. (15 cm) from the surface of the floor. TRU mixed waste containers that have been removed from Contact- or Remote-Handled Packaging shall be placed at a designated storage area or WHB and TMF Staging Area inside the WHB Unit or RH Complex so as to preclude exposure to the elements.

Secondary containment at the ~~NE Storage~~ CH Bay Storage Area, Room 108 and Airlock 107 Staging Area, WHB Staging Area, TMF Staging Area and the Shielded Storage Area inside the WHB Unit shall be provided by the WHB Unit floor (See Figure M1-1). ~~The WHB Unit is~~ These areas are engineered such that during normal operations, the floor capacity is sufficient to contain liquids upon release. Secondary Containment at the Derived Waste Storage Area of the WHB Unit will be provided by a polyethylene standard drum pallet. The Parking Area Unit, Parking Area Staging Area and TRUDOCK Storage Staging Area of the WHB Unit require no engineered secondary containment since no waste is to be stored there unless it is protected by the Contact- or Remote-Handled Packaging.

Calculations to determine the floor surface area required to provide secondary containment in the event of a release are based on the maximum quantity of liquid which could be present within ten percent of one percent of the volume of all the containers or one percent of the capacity of the largest single container, whichever is greater.

Secondary containment at storage locations inside the RH Bay and Cask Unloading Room is provided by the cask. Secondary containment at storage locations inside the Transfer Cell is provided by the RH-TRU 72-B cask or shielded insert. Secondary containment at storage locations in the Facility Cask Loading Room is provided by the facility cask. In the Hot Cell, waste containers are stored in either the drum carriage unit or in canister sleeves. The Lower Hot Cell provides secondary containment as described in section M1-f(2). In addition, the RH Bay, Hot Cell, and Transfer Cell contain 220-gallon (833-L) (Hot Cell), 11,400-gallon (43,152-

L)(RH Bay), and 220-gallon (833-L)(Transfer Cell) sumps, respectively, to collect any liquids.

M1-1f(1) Secondary Containment Requirements for the Indoor Storage and Staging Areas the WHB Unit

The maximum volume of TRU mixed waste that will be stored in the NE Storage Area of the WHB is ~~seven facility pallets @ 4 SWBs per pallet = 28 SWBs of waste. 28 SWBs @ 496 gal (1,878 L) per SWB = 13,888 gal (52,570 L) waste container capacity. 13,888 gal (52,570 L) x ten percent of the total volume = 1,389 gal (5,258 L) of waste. Since 1,389 gal (5,263 L) is greater than 496 gal (1,878 L), the volume of the largest single container, the configuration of all SWBs in the storage area is used for the calculation of secondary containment requirements. 1,389 gal (5,258 L) of liquid x one percent liquids = 13.9 gal (52.6 L) of liquid for which secondary containment is needed.~~

The maximum volume of TRU mixed waste on facility pallets that will be stored in the CH Bay Storage Area, and Shielded Storage Area of the WHB is 18 facility pallets @ 2 TDOPs per pallet = 36 TDOPs of waste. 36 TDOPs @ 1,200 gal (4,540 L) per TDOP = 43,200 gal (163,440 L) waste container capacity. 43,200 gal (163,440 L) x ten percent of the total volume = 4,320 gal (16,344 L) of waste. Since 4,320 gal (16,344 L) is greater than 1,200 gal (4,540 L), the configuration of possible TDOPs in the storage area is used for the calculation of secondary containment requirements. 4,320 gal (16,344 L) of liquid x one percent liquids = 43.2 gal (163.4 L) of liquid for which secondary containment is needed.

~~The maximum volume of TRU mixed waste that will be stored in the Shielded Storage Area of the WHB Unit is one facility pallet @ 4 SWBs per pallet = 4 SWBs of waste. 4 SWBs @ 496 gal (1,878 L) per SWB = 1,984 gal (7,510 L) waste container capacity. 1,984 gal (7,510 L) x ten percent of the total volume = 198.4 gal (751 L) of waste. Since 198.4 gal (751 L) is less than 496 gal (1,878 L), the volume of the largest single container, the volume of the largest container (an SWB) in the storage area is used for the calculation of secondary containment requirements. 496 gal (1,878 L) of liquid x one percent liquids = 4.96 gal (18.8 L) of liquid for which secondary containment is needed.~~

The maximum volume of TRU mixed waste that will be stored in the Derived Waste Storage Area of the WHB Unit is one SWB. 1 SWBs @ 496 gal (1,878 L) per SWB = 496 gal (1,878 L) waste container capacity. Since the maximum storage volume of 496 gal (1,878 L) is equal to the volume of the largest single container, the volume of the a single SWB is used for the calculation of secondary containment requirements. 496 gal (1,878 L) of liquid x one percent liquids = 4.96 gal (18.8 L) of liquid for which secondary containment is needed.

The maximum volume of TRU mixed waste on facility pallets that will be stored in the TMF

1 Staging Area of the WHB is 14 facility pallets @ 2 TDOPs per pallet = 28 TDOPs of waste. 28  
2 TDOPs @ 1,200 gal (4,540 L) per TDOP = 33,600 gal (127,120 L) waste container capacity.  
3 33,600 gal (127,120 L) x ten percent of the total volume = 3,360 gal (12,712 L) of waste. Since  
4 3,360 gal (12,712 L) is greater than 496 gal (1,878 L), the volume of the largest single  
5 container, the configuration of TDOPs in the staging area is used for the calculation of  
6 secondary containment requirements. 3,360 gal (5,257 L) of liquid x one percent liquids = 33.6  
7 gal (127.1 L) of liquid for which secondary containment is needed.

8  
9 The maximum volume of TRU mixed waste on facility pallets that will be stored in the WHB  
10 Staging Area of the WHB is 8 facility pallets @ 2 TDOPs per pallet = 16 TDOPs of waste. 16  
11 TDOPs @ 1,200 gal (4,540 L) per TDOP = 19,200 gal (72,600 L) waste container capacity.  
12 19,200 gal (72,600 L) x ten percent of the total volume = 1,920 gal (7,260 L) of waste. Since  
13 1,920 gal (7,260 L) is greater than 496 gal (1,878 L), the volume of the largest single container,  
14 the configuration of TDOPs in the staging area is used for the calculation of secondary  
15 containment requirements. 1,920 gal (7,260 L) of liquid x one percent liquids = 19.2 gal (72.6 L)  
16 of liquid for which secondary containment is needed.

17  
18 The maximum volume of TRU mixed waste on facility pallets that will be stored in Room 108 is  
19 8 facility pallets @ 2 TDOPs per pallet = 16 TDOPs of waste. 16 TDOPs @ 1,200 gal (4,540 L)  
20 per TDOP = 19,200 gal (72,600 L) waste container capacity. 19,200 gal (72,600 L) x ten percent  
21 of the total volume = 1,920 gal (7,260 L) of waste. Since 1,920 gal (7,260 L) is greater than  
22 496 gal (1,878 L), the volume of the largest single container, the configuration of TDOPs in the  
23 staging area is used for the calculation of secondary containment requirements. 1,920 gal  
24 (7,260 L) of liquid x one percent liquids = 19.2 gal (72.6 L) of liquid for which secondary  
25 containment is needed.

26  
27 The maximum volume of TRU mixed waste that will be stored in the Hot Cell is 10 RH TRU  
28 drums @ 55 gal (210 L) per drum = 550 gal (2100 L) of waste in drums. Additionally, 6 RH TRU  
29 facility canisters @ 235 gal (891L) per canister = 1,410 gal (5,346 L) of waste in canisters for a  
30 combined total 1,960 gal (7,419L). And 1,960 gal (7,419 L) of waste x ten percent of total  
31 volume = 196 gal (741.9 L) of waste. Secondary containment for liquids will need to have a  
32 capacity 196 gal (741.9L). Since 196 gal (741.9 L) is less than the volume of the single  
33 container of 235 gal (890 L) therefore, the larger volume is used for determining the secondary  
34 containment requirements. 235 gal (890 L) of waste x one percent liquids = 2.35 gal (8.9 L) of  
35 liquid needed for secondary containment.

36  
37 The maximum volume of TRU mixed waste that will be stored in the Transfer Cell is one RH  
38 TRU canister or one RH TRU facility canister @ 235 gal (890 L) per canister x ten percent of  
39 total volume = 23.5 gal (8.90 L) of waste. Since 23.5 gal (8.90 L) is less than the volume of the  
40 single container of 235 gal (890 L) therefore, the larger volume is used for determining the

secondary containment requirements. 235 gal (890 L) of waste x one percent liquids = 2.35 gal (8.9 L) of liquid needed for secondary containment.

#### M1-1f(2) Secondary Containment Description

The following is a calculation of the surface area the quantities of liquid would cover. Using a conversion factor of 0.1337 ft<sup>3</sup>/gal (0.001 m<sup>3</sup>/L) and assuming the spill is 0.0033 ft (0.001 m) thick, the following calculation can be used:

gallons x cubic feet per gallon ÷ thickness in feet = area covered in square feet

#### ~~NE Storage Area~~ CH Bay Storage Area and Shielded Storage Area

$$~~43.9~~ 43.2 \text{ gal} \times 0.1337 \text{ ft}^3/\text{gal} \div 0.0033 \text{ ft} = ~~563~~ 1,750 \text{ ft}^2 (~~52.3~~ 162.7 \text{ m}^2)$$

#### TMF Staging Area

$$33.6 \text{ gal} \times 0.1337 \text{ ft}^3/\text{gal} \div 0.0033 \text{ ft} = 1,361 \text{ ft}^2 (126.4 \text{ m}^2)$$

#### WHB Staging Area

$$72.6 \text{ gal} \times 0.1337 \text{ ft}^3/\text{gal} \div 0.0033 \text{ ft} = 2,941 \text{ ft}^2 (273.5 \text{ m}^2)$$

#### Room 108 Staging Area

$$19.2 \text{ gal} \times 0.1337 \text{ ft}^3/\text{gal} \div 0.0033 \text{ ft} = 778 \text{ ft}^2 (72.3 \text{ m}^2)$$

#### ~~Shielded Storage Area~~

$$~~4.96 \text{ gal} \times 0.1337 \text{ ft}^3/\text{gal} \div 0.0033 \text{ ft} = 201 \text{ ft}^2 (18.67 \text{ m}^2)~~$$

#### Hot Cell

$$2.35 \text{ gal} \times 0.1337 \text{ ft}^3/\text{gal} \div 0.0033 \text{ ft} = 95 \text{ ft}^2 (8.8 \text{ m}^2)$$

#### Transfer Cell

$$2.35 \text{ gal} \times 0.1337 \text{ ft}^3/\text{gal} \div 0.0033 \text{ ft} = 95 \text{ ft}^2 (8.8 \text{ m}^2)$$

The portion of the WHB Unit designated for storage of CH TRU mixed waste which includes the

CH Bay Storage Area, and Shielded Storage Area has 33,175 20,914.5 ft<sup>2</sup> (3,082 1,945.7 m<sup>2</sup>) of floor space, the NE Storage Area in the northeast corner of the WHB Unit (Figure M1-7) has 2,924 ft<sup>2</sup> (272 m<sup>2</sup>) of floor space, and the Shielded Storage Area has 292.5 ft<sup>2</sup> (27.2 m<sup>2</sup>) of floor space. The CH Bay Storage Area, and Shielded Storage Area requires 1,750 ft<sup>2</sup> (162.7 m<sup>2</sup>) for containment, therefore there is sufficient floor space to contain a release of ten percent of one percent of containers in those storage areas.

The portion of the WHB designated for the staging of CH TRU mixed waste and identified as the TMF Staging Area has 9,081 ft<sup>2</sup> (844.5 m<sup>2</sup>). The TMF Staging Area requires 1,361 ft<sup>2</sup> (126.4 m<sup>2</sup>) for containment, therefore there is sufficient floor space to contain a release of ten percent of one percent of containers in this staging area.

The portion of the WHB designated for the staging of CH TRU mixed waste and identified as the WHB Staging Area has 4,851 ft<sup>2</sup> (450.7 m<sup>2</sup>). The WHB Staging Area requires 2,941 ft<sup>2</sup> (273.5 m<sup>2</sup>) for containment, therefore there is sufficient floor space to contain a release of ten percent of one percent of containers in this staging area.

The portion of the WHB designated for the staging of CH TRU mixed waste and identified as Room 108 Staging Area has 6,744 ft<sup>2</sup> (627.2 m<sup>2</sup>). The Room 108 Staging Area requires 778 ft<sup>2</sup> (72.3 m<sup>2</sup>) for containment, therefore there is sufficient floor space to contain a release of ten percent of one percent of containers in this staging area.

The Hot Cell and Transfer Cell are the only portions of the RH Complex managing RH TRU mixed waste outside of casks or canisters. The Hot Cell has 873 ft<sup>2</sup> (81 m<sup>2</sup>) of floor space and the Transfer Cell has RH TRU mixed waste has 1,012 ft<sup>2</sup> (94 m<sup>2</sup>) of floor space. The Hot Cell and Transfer Cell require only 95 ft<sup>2</sup> for containment, therefore there is sufficient floor space to contain a release of ten percent of one percent of containers in these storage areas.

Thus, the floor area of the NE Storage Area and the Shielded Storage Area of the WHB Unit provide sufficient secondary containment to contain a release of ten percent of one percent of the volume of all of the containers, or one percent of the capacity of the largest container, whichever is greater.

In addition, both the Hot Cell and the Transfer Cell each contain a 220 gal (833 L) sump that will collect any liquids that spill from containers.

Derived Waste Storage Area

The derived waste containers in the Derived Waste Storage Area will be stored on standard drum pallets, which provides approximately 50 gal (190 L) of secondary containment capacity. Thus the secondary containment capacity of the standard drum pallet is sufficient to contain a release of ten percent of one percent of the largest container (4.96 gal or 18.8 L).

Parking Area Unit

Containers of TRU mixed waste to be stored in the Parking Area Unit and Parking Area Staging Area will be in Contact-or Remote-Handled Packages. There will be no additional requirements for engineered secondary containment systems.

M1-1g Special Requirements for Ignitable, Reactive, and Incompatible Waste

Special requirements for ignitable, reactive, and incompatible waste are addressed in 20.4.1.500 NMAC (incorporating 40 CFR §§264.176 and 264.177). Permit **Module II** precludes ignitable, reactive, or incompatible waste at the WIPP. No additional measures are required. Verification and examination of waste by the Permittees will further show that no ignitable, reactive or corrosive waste has been disposed at WIPP.

M1-1i Control of Run On

The WHB Unit is located indoors which prevents run-on from a precipitation event. In addition, the **CH TRU** containers are stored on facility pallets, containment pallets or standard drum pallets, which elevate the CH TRU mixed waste containers at least 6 in. (15 cm) off the floor, or in Contact Handled Packages, so that any firewater released in the building will not pool around containers. Within the RH Bay, Cask Unloading Room, Transfer Cell, and Facility Cask Loading Room, waste containers are stored in casks or shielded inserts and protected from any potential run on. Any firewater released in the building will not pool around the waste containers as they are stored in casks, or shielded inserts. Within the Hot Cell, there is no source of water during operations. However, control of run-on is provided by the Lower Hot Cell, which lies below a sloped floor surrounded by a grating and canister sleeves in the Hot Cell above.

In the Parking ~~Lot~~Area Unit, and Parking Area Staging Area the containers of TRU mixed waste are always in Contact-or Remote-Handled Packages which protect them from precipitation and run on. Therefore, the WIPP container storage and staging units will comply with the requirements of 20.4.1.500 NMAC (incorporating 40 CFR §264.175(b)(4)).

TABLE M1-3  
RH TRU MIXED WASTE HANDLING EQUIPMENT CAPACITIES

<u>CAPACITIES FOR EQUIPMENT</u>	
<u>RH Bay Bridge Crane</u>	<u>140 tons main hoist</u> <u>25 tons auxiliary</u> <u>hoist</u>
<u>RH-TRU 72-B Cask Transfer Car</u>	<u>20 tons</u>
<u>CNS 10-160B Cask Transfer Car</u>	<u>35 tons</u>
<u>Transfer Cell Shuttle Car</u>	<u>29 tons</u>
<u>Hot Cell Crane</u>	<u>15 tons</u>
<u>Overhead Powered Manipulator</u>	<u>2.5 tons</u>
<u>Facility Cask Rotation Fixture</u>	<u>No specific load</u> <u>rating</u>
<u>Cask Unloading Room Crane</u>	<u>25 tons</u>
<u>6.25 Ton Grapple Hoist</u>	<u>6.25 tons</u>
<u>Facility Cask Transfer Car</u>	<u>40 tons</u>
<u>MAXIMUM GROSS WEIGHTS OF RH TRU CONTAINERS</u>	
<u>RH TRU Mixed Waste Canister</u>	<u>8,000 lbs</u>
<u>55-Gallon Drum</u>	<u>1,000 lbs</u>
<u>RH TRU Facility Canister</u>	<u>10,000 lbs</u>
<u>MAXIMUM NET EMPTY WEIGHTS OF EQUIPMENT</u>	
<u>Shielded RH-TRU 72-B Cask</u>	<u>37,000 lbs</u>
<u>Shielded CNS 10-160B Cask</u>	<u>57,500 lbs</u>
